Charpy impact test Wikipedia

The Charpy impact test, also known as the Charpy V-notch test, is a standardized high strain-rate test which determines the amount of energy absorbed by a material during fracture. This absorbed energy is a measure of a given material's notch toughness and acts as a tool to study temperature-dependent ductile-brittle transition.

Impact Test and Notched Impact Test Polymerservice

Impact Test and Notched Impact Test with Charpy Configuration The (notched) Charpy impact test according to DIN EN ISO 179 evaluates the toughness behaviour of polymers at impact load. To determine the Charpy impact strength a cU unnotched specimen are used and to determine the notched Charpy impact strength a cN specimens with V-notches are tested..

Standard Test Method for Determining the Charpy Impact

This test method requires specimens to be made with a milled notch (see Note 2). The notch produces a stress concentration which promotes a brittle, rather than a ductile, fracture. The results of this test method are reported in terms of energy absorbed per unit of specimen width (see Note 3).

Charpy vs Izod An Impact Testing Comparison Element

Both Charpy and Izod impact testing are popular methods of determining impact strength, or toughness, of a material. In other words, these tests measure the total amount of energy that a material is able to absorb. This energy absorption is directly related to the brittleness of the material. Brittle materials, such as ceramics or glass, tend to have lower absorption rates than ductile materials like copper or aluminum.

Charpy Izod Impact Testing kA Testing Facility

The Charpy Impact Test is a standard sized specimen mounted horizontally in the apparatus and the pendulum hammer swung to impact the middle of the sample. For Charpy Tests the samples can be either notched or unnotched.

What is a Charpy Impact Test Definition from Corrosionpedia

A Charpy impact test is a test method that is used to determine the toughness of a material. Once machined, a specimen of the material being tested is loaded into a Charpy impact test machine. The amount of force required to fracture the material with a swinging pendulum is used to calculate the toughness.
